EDUCATION

University of Maryland, College Park

Ph.D., Development Economics, Expected completion May 2027
Dissertation: “Firm Growth in Developing Countries”

University of Wisconsin-Madison

M.S., Economics, 2020

Xiamen University

B.S., Mathematical Finance, 2018
B.A., Literature, 2018

FIELDS OF INTEREST

Development Economics, Experimental Economics, Personnel Economics, Applied Econometrics

RELEVANT POSITIONS

Consultant, World Bank Group	2023–2026
------------------------------	-----------

SELECTED AWARDS & RESEARCH GRANTS

Research Grant, Chiang Ching-Kuo Foundation (with Jing Cai) (\$29,756)	2025
Dissertation Enhancement Fund, University of Maryland (\$4,000)	2025
Jacob K. Goldhaber Travel Grant, University of Maryland (\$800)	2023
Best Second-Year Paper Award, University of Maryland	2023
Dean’s Fellowship, University of Maryland (\$2,500 × 2)	2020-2021
Dean’s List, Xiamen University	2018
First-Class Academic Excellence Scholarship, Xiamen University	2015

PROFESSIONAL ACTIVITIES

Referee, *Journal of Development Economics*

RESEARCH PAPERS

“Enhancing Decision-Making: The Impact of Information Provision on Worker Task Assignment” (Job Market Paper)

Managers in developing-country manufacturing firms often face substantial challenges in assigning the right workers to the right tasks, in part because they have limited information about workers’ relative skills and preferences. We conduct a randomized field experiment in three large garment manufacturing plants in China to study whether providing managers with information about workers improves task allocation and firm outcomes. We provide randomly selected team managers with either reports summarizing workers’ efficiency across tasks or reports that additionally include information on workers’ task preferences. We find that providing information increases team efficiency by approximately 10 percent and reduces worker turnover within four months by 34–47 percent. Exploring the underlying mechanisms, we find that the intervention substantially improves managers’ knowledge of workers, which leads to improved task assignment along the efficiency dimension. However, despite learning about multiple dimensions of worker performance and preferences, managers selectively incorporate this information into their assignment decisions. The results show that information provision can improve worker-task matching and organizational performance, but that managers’ ability to process and apply information across multiple dimensions may limit the extent to which broader information gains translate into changes in managerial decisions.

“Environmental Justice: Poverty Alleviation and the Entry of Polluting Firms”

This paper studies the impact of a large-scale poverty alleviation program in China, which aims at promoting economic development in designated National Poor Counties, on the entry of polluting firms. Using rich data on firm registration and performance, I use both difference-in-differences and triple difference models to estimate the policy impact. The results show that poverty alleviation attracts both polluting firms and non-polluting firms. However, the policy attracts fewer polluting firms than non-polluting firms—compared with the entry of nonpolluting firms, the policy decreases the average number of new polluting firms by 16% annually. Moreover, the estimation of dynamic effects suggests that the negative policy impact on the entry of polluting firms increases over time and persists in the long run. Exploring mechanisms driving the impact, I show that first, the poverty alleviation policy increases the exit of polluting firms by 23%, indicating a more difficult industrial environment for polluting firms to survive. Second, it increases regional income that could lead to an increase in people’s marginal willingness to pay for environmental quality improvement. Lastly, National Poor Counties tend to provide smaller government support to polluting firms relative to nonpolluting firms.

“Who Benefits from SME Credit? Evidence from Bank Lending in Bangladesh”

(with Miriam Bruhn, Mahjabeen Haji, and Sandeep Singh)

Small and medium-sized enterprises (SMEs) face persistent barriers to formal credit, and while expanding loan access improves firm performance on average, less is known about which firms benefit most. This paper provides new evidence from Bangladesh, in collaboration with BRAC Bank, combining administrative records on the universe of SME loan applicants in 2021–2022 with original survey data on roughly 2,000 firms. The identification strategy compares accepted and rejected applicants who passed an initial screening, using coarsened exact matching. On average, receiving a loan increased sales by 18 percent, profits by 20 percent, and employment by 8 percent.

But the employment gains are uneven: the average effect is driven entirely by firms with at least five employees, which saw a 14-percent increase in employment. Expanding credit to smaller firms can raise their owners' incomes, but only larger SMEs create jobs for others.
